Escherichia coli K-12 chromosomal region from 92.8 to 00.1 minutes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      On Apr 17, 1996 this sequence version replaced gi:536929.
This sequence was determined as part of the E. coli Genome Project (Frederick R. Blattener, director) at the University of Wisconsin-Medison. Supported by award HG00301 from the NIH Human Genome Project. The entire sequence was independently determined from E. coli MG1655; overlaps with other sequence determined are annotated. The start of this entry overlaps the end of the entry ECUWW89 (100006) by 1885 bp.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                1 GVESVRGLKILSVIGLLFVL......EEMAKELVELSKKDSKKDNK 335

The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidemidis polypeptide with any cc of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as correct of in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); vector; a cell comprising a recombinant expression vector of (1); vector; a cell comprising a polypeptide; an isolated nucleic acid (1); vaccine composition for prevention or treatment of an S. epidermidis or infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a subject for S. epidermidis infection; a computer of an S. epidermidis of the sequence of a subject for S. epidermidis infection; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide system for identifying fragments of the Staphylococcus genome of commercially importance; a computer based system for identifying fragments of commercially important nucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids of commercially important nucleic acid fragments of the staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus procession of the invention. This sequence encodes a S. epidermidis protein of the invention.
                                                                                                                       New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1008 BP; 404 A; 129 C; 188 G; 287 T; 0 U; 0 Other;

New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

SEQ ID NO 34954; 1766pp; English. Claim

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) an bost cell containing the vector; (3) an isolated on the polypeptide (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation or that has an activity against a biological pathway for proliferation or that has an activity against a biological pathway or equired for proliferation, or that that inhibits cellular proliferation of an organism acts; (9) manufacturing an activity, against a biological pathway in which a proliferation or the biological correquired for proliferation, or that that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprise proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprises or compound; a sectivity; (11) a culture comprise the compound that inhibits proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecic acids required for cellular proliferation to isolate candidate molecic acids required for proliferation in cells other than S. aureus, S. typhimurium, c. prokaryotic essential genes. Note: The sequence data for this patent did control of c ftp.wipo.int/pub/published_pct_sequences

AAS54519 standard; DNA; 1014 (first entry) 13-FEB-2002 AAS54519; RESULT 3

cellular proliferation gene; antibiotic; Staphylococcus aureus DNA for cellular proliferation protein #831. Antisense; ds; prokaryotic antibacterial; drug design.

Staphylococcus aureus. WO200170955-A2.

27-SEP-2001.

84

                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes coli, Staphylococcus aureus, Salmonala typhi, Klebaiela pneumoniae, coli, Staphylococcus aureus, Salmonala typhi, Klebaiela pneumoniae, consetul for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can tasense nucleic acids of sequence in rational drug discovery programmes. The bused to screen compounds in rational drug discovery programmes. The cantisense nucleic acid sequence is also useful to screen for homologous coloranisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent column part of the printed specification, but was obtained in the first control format directly from WIPO at

Novel surface-exposed immunogenic polypeptide of Staphylococcus aureus containing receptors for siderophores or iron-binding ligands, useful for producing antibodies effective against Staphylococci infection. (DSQU-) D-SQUARED BIOTECHNOLOGIES Claim 4; Page 53; 62pp; English. 2003-300870/29 WPI; 2003-300870, P-PSDB; ABR41865. Scott DL;

The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA03. To isolate SEIP genes, an expression library of S. aureus genomic DNA was screened with anti-SEIP antisera. DNA was isolated from clones expressing SEIPs, and functional domains. The SEIP encoded by the present DNA sequence has sequence homology with the siderophoral periodic by periplasmic binding production and recovery of SEIPs. The SEIPs can be used individually, or in combination, to produce anti-staphylococcal antibodies useful in passive or active immunisation strategies to prevent or contain etaphylococcal infection. They can also be used to develop diagnostic авваув

Claim 14; SEQ ID NO 7644; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antiseanse sequences given in the specification where expression the 6213 antiseanse sequences given in the specification where expression of the 6213 antiseanse acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of proliferation at the form cell containing the vector; (3) an isolated polypeptide or its framement whose expression is inhibited by the antisense collypeptide or its framement whose expression is inhibited by the antisense collypeptide; (6) inhibiting cellular cc proliferation, or that has an activity against a biological pathway the grounding and proliferation, or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway the proliferation or that has an activity against a biological pathway the proliferation or that has an activity against a biological pathway in which a proliferation or that inhibits proliferation of an organism acts, (9) maniferation required gene or ties gene required for cellular proliferation of an organism acts, (9) maniferation required gene or ties gene or which each of the strains is present in a culture or collection of compound's activity, (11) a culture comprising strains in which the gene compound that inhibits proceed or a gene on which each of the strains is present in a culture or collection of creatins; or (13) identifying the target of a compound that inhibits the cc compound and that inhibits of collection of creatins; or (13) identifying the target of a compound that inhibits for collection of creating for homologous nucleic acids are useful for collection to solate candidate molecules for rational genes. Note: The activity man of the printed genes to sequence data for this patent discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candidate mol

English NO 5331; 49pp; 6; SEQ ID Claim

The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus genes of the invention

221

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia Coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facazils. The invention is also useful for the identification of potential new targets for antibiocic development. The antisense nucleic acids can also be used to identify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GluasnileaspalaphelysThrileSerLysAlaLeuGlyLysGluGluGluGlyLys 175
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     iysargi.
antibodies capable of binding to the expresse these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AGAGAAAAAATTGGGGAATTATACTTCTGTAGGTACACGTAAACAGCCAAACTTAGAGGAA 300

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes coli, Staphylococcus aureus, Salmonala typhi, Klebbiela pneumoniae, coli, Staphylococcus aureus, Salmonala typhi, Klebbiela pneumoniae, compactives and Enterococcus faccalis. The invention is also pseudomonas aeruginosa and Enterococcus faccalis. The invention is also consecut for the identification of potential new targets for antibiotic compacting used in proliferation, to express these proteins, and to obtain corrections used in proliferation, to expressed proteins, and to obtain contibodies capable of binding to the expressed proteins. The pressence contisense nucleic acid sequence is also useful to screen for homologous antisense nucleic acid sequence encodes an essential prokaryotic of organisms. The present sequence encodes an essential prokaryotic colorganisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent cold not form part of the printed specification, but was obtained in celectronic format directly from WIPO at

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coll, Staphylococcus aureus, Salmonella typhi, Klebbiella pneumoniae, coll, Staphylococcus aureus, Salmonella typhi, Klebbiella pneumoniae, con seful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify noteins used in proliferation, to express these proteins, and to obtain antisense nucleic acids equence is also useful to screen for homologous con used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous colorganisms. The present sequence encodes an essential prokaryotic collular proliferation protein. Note: The sequence data for this parent collular proliferation protein. Note: The sequence data for this parent collular proliferation protein. The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, producing hyperimmune serum-reactive antigens from a pathogen, a tissue or host prone to auto-immunity, where the antigens are coordine, comprises providing antibody preparation from a plasma to pool of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the coordination to their hyperimmune serum-reactive antigens comprising any of the immunity. The hyperimmune serum-reactive antigens comprising any of the correction preparation, particularly a vaccine against staphylococcal pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The corrections or colonisation caused for diagnostic and imaging purposes. Other conditions may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral companies in the polynucleotide sequence represents staphylococcal DNA relating to the method for identifying and producing pathogen specific antigens of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying, isolating and producing hyperimmune serum-reactive antigen
from a pathogen, for preparing vaccine or medicament for treating or
preventing e.g. staphylococcal infections, comprises providing antibody

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid

mucleic acid; (2) a host expression is inhibited by the antisense

conciding a polypeptide whose expression is inhibited by the antisense

conciding a polypeptide (5) production the polypeptide; (6) inhibiting cellular

concideration or the activity of a gene in an operon required for

proliferation or the activity of a gene in an operon required for

proliferation or that has an activity against a balological pathway

concidentifying a gene required for cellular proliferation; (8)

defentifying a gene required for cellular proliferation or the biological

compound a proliferation-required gene or its gene product is

compound a activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound s activity; (11) a culture comprising strains in which the gene

compound so or each of the strains is present in a culture or collection of

compound so or each of an organism. The antisense nucleic acids required

confideration of an organism. The antisense nucleic acids required

confideration of an organism. The present sequence is one of the target or proliferation to isolate candidate molecules for retional drug discovery programs, or for screening for molecules of the printing and profice sesential gene or servents
                                                                                                                                                                                                                                                                                                                                                                       3
                                                                                                                                                                                                                                                                                                                                                                   Zyskind X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense nucleic acids, useful for identifying proteins or s
for homologous nucleic acids required for cellular proliferation
isolate candidate molecules for rational drug discovery programs.

The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            33 AsnSerSerLysGluSerSerLysAspGlyValGluIleLysHisGluGluGlyThrThr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              wew scapnylococcus aureus protein, useful as a vaccine for treating or preventing Staphylococcal infection, specifically an infection caused S. aureus, e.g. sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13 VallleGlyLeuLeuPheValLeulleAlaThrAlaAlaCysGlyAsnAsnSerSerSer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AspTyrAsnGluAsnIleAspAlaPheLysThrIleSerLysAlaLeuGlyLysGluGlu 172
                                                                                                                                                                                                                         The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA05. To isolate SEIP genes, an expression library of S. aureus genomic DNA was screened with anti-SEIP antisera. DNA was isolated from clones expressing SEIPs, and functional domains. The SEIP encoded from clones expressing SEIPs, and functional domains. The SEIP encoded by the present DNA sequence has sequence homology with the siderophore family of periplasmic binding proteins. The invention provides methods for the identification, for combination, to produce anti-staphylococcal antibodies used individually, or passive or active immunisation strategies to prevent or contain stabhylococcal infection. They can also be used to develop diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          72

The polypeptide, and polynucleotide encoding it, are derived from Staphylococcus aureus. Cells expressing ligands binding the polypeptide can be used to isolated candidate compounds that

10 Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used isolate antimicrobial compounds, and in vaccines against S. aureus infection.

Claim 9; Page 672-673; 989pp; English.

The present sequence encodes 3 Staphylococcus aureus proteins of unknown function. The present sequence was isolated from a library of clones of S. aureus WCHM 29 in Escharichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The encoded protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. sureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock

Sequence 2247 BP; 704 A; 397 C; 307 G; 802 T; 0 U; 37 Other;

The present invention describes a method for generating an expression to the present invention describes a method for generating an expression of the genome of a competent Gram-positive bacterium host cell. The method to the genome of a competent Gram-positive bacterium host cell. The method comprises: (a) providing a non-replicating linear integration cassette; and (b) introducing the linear integration cassette into the host cell and selecting or screening for host cells that produce the polypeptides of interest; (b) a 5' flanking polynucleotide encoding one or of interest. The cassette comprises: (a) a polynucleotide segment comprises of the polynucleotide of the segment comprising a first homologous region located in the 3' end of the segment; and (c) a 3' flanking comprising a second homologous region located in the 5' end of the polynucleotide segment downstream of the polynucleotide of (1) and comprising a second homologous region located in the 5' end of the segment. The first and second homologous regions are at least 50', 1000 esement. The first and second homologous regions are at least 80, 85, 90 or 1500 bp, each of which has a sequence identity of at least 80, 85, 90 or 1500 bp, each of which has a sequence identity of at least 80, 85, 90 or 1500 bp, each of producing a polypeptide of interest. The method is useful (2) a method of producing a polypeptide of interest. The method is useful consequence recombination into the genome of a competent Gram-positive bacterium host cell. The present sequence represents a Bacillus subtilis subtilis subtilis subtilis integrated. present invention.

The invention describes a method of monitoring differential expression of a genes in a first Bacillus cell relative to expression of the genes in cher Bacillus cells, comprising hybridising labelled nucleic acid probes cother Bacillus cells to a substrate containing array of Bacillus accommic sequenced tags (GST), examining the array, and determining cellative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of a spot in the array. The method is useful for megenes in a first Bacillus cells. The method is useful for monitoring in one or more second Bacillus cells. The method is useful for monitoring cones, identifying possible functions of unknown open reading frames and connecting gene copy number variation and stability. Monitoring changes continue cells adapt to changes in culture conditions, con with a stression of genes may be used to provide a representation of the way con which Bacillus cells adapt to changes in culture conditions, con without a stress or other physiclogical provocation. Extensive follow cup characterisation is unnecessary, when one spot on an array equals one copen con page of the configuration is available.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens of control amplification of the genes. Antibodies (Ab) raised against the and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens. e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector and antibiotics produced by P. C. mimals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Luminescens. Cells transformed to express the genes are useful for recommentation of the proteins, particularly toxins and cantibacterials useful as insecticides, bactericides and fungithat care sensitive to P. luminescens and the proteins or fungi that care sensitive to P. luminescens encoded toxins or antibiotics) and as containing the genes and the proteins are as virulence care sensitive to the indirection of the genes and the proteins are as virulence containing the genes and the proteins are as virulence containing the genes and the proteins are as virulence containing the genes and the proteins are as virulence containing the genes and the proteins are as virulence containing the genes and the proteins are as virulence containing the genes and the proteins are as virulence contains and an encoded toxing or antibiotics) and as containing the genes and the proteins are as virulence contains and manual sequence represents one of the isolated P. luminescens genes ACETOR AC 479 239 536 240 LeuSerLysTyrLeuLysGlyProTyrLeuGlnMetAsnThrGluThrLeuSerGlnVal 259 LysGluLeuGluLysAspProValTrpLysLysLeuAsnAlaValLysAsnGlnArgVal 298 :::||| 420 ATTCTTCTGGGGAACACAAATGAAGAAATCACCGTGCGCGATGAAAACTTTTTCACG 220 GlyGlnPheLeuSerGlnLeuGlyPheLysGluAlaLeuSerAspAspValThrLysGly GATGCCGAAAACGGTGAATCGTCATATAAAATGACGCTCGAACAGCTGCTTGAGAAA AsnProGluArgMetPheIleMetThr---AsnLysAlaSerSerAsnGluProSerLeu 537 260 597 279 657

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises the amino acid and coding sequences of proteins from Photorhabdus luminescens which are active against insects. The proteins of the invention are toxic to Lepidoptera, specifically the genera Plutella, Helichia, Helicoverpa, Spodoptera and ostrinia. The DNA and protein sequences of the invention are useful in the preparation of transgenic, insect-resistant plants, specifically wheat and maize. The present Photorhabdus luminescens genomic DNA contains the coding sequence for the two insecticide proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid from Photorhabdus luminescens, useful for producing insecticidal polypeptides active against Lepidoptera, and for producing insect resistant transgenic plants.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites promiter operated by linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (1) a host cell containing the vector; (3) an isolated antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway confirming a gene required for cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or ties gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts. (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits or compound's activity; (11) a culture comprising strains in which the estrain or expension or indicate molecules for rational compound's activity; (11) a culture comprising strains or close or described for proliferation to isolate candidate molecules for rational required for proliferation to isolate candidate molecules for rational required for proliferation in calls order than S. auteurs, s. typhimmrium, confirmed for the printed specification, but was obtained in the printed pot the printed specification, but was obtained in the printed for proliferation or sequences.
                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonala typhi, Klebsiela pneumoniae, coli, Staphylococcus aureus, Salmonala their provention is also useful for the identification of potential new targets for antibiotic consecul facelopment. The antisense nucleic acids can also be used to identify antibodies capable of binding to the expressed proteins, and to obtain the compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous colorations and the protein are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent coloration form part of the printed specification, but was obtained in the content of the coloration and the coloration in a coloration of the coloration and coloration in the coloration of the coloration and coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the coloration in the colorati

"I'm a vector comptriants a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host call contenting the vector; (3) an isolated antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide of the fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits cellular proliferation; (8) required for proliferation, or that inhibits proliferation or the biological pathway in which a proliferation-required gene or its gene product lites or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism. The antisense nucleic acids are useful for which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the code or (13) identifying the target of a compound that inhibits the code or cellular proliferation in cells other than S. aureus, S. typhimurium, C. for cellular proliferation in cells other than S. aureus, S. typhimurium, C. prokaryotic essential genes. Note: The sequence data for this patent did for proliferation in the printed specification, but was obtained in cellectuals.

The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAS46232-AAS46278 represent

Identifying compounds that modulate a newly identified mar regulated polypeptide activity, useful as antimicrobial compounds, involves contacting the polypeptide with a test compound.

The invention relates to an isolated nuclear act completes any and the facts antisense sequences given in the specification where expression of the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concoling a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contisense nucleic acid; (7) identifying a compound that influences the activity of proliferation or that has an activity against a biological pathway contisensed for proliferation, (7) identifying a compound that influences the activity of required for proliferation or that has an activity against a biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound accompound and the capable of the strains is present in a culture or collection of compound activity; (11) a culture comprising strains in which the gene contist is overexpressed or underexpressed; (12) determining the extent of which each of the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids required for identifying proteins or screening for homologous nucleic acids required contains and proverse and identifying proteins or for screening candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is one of the rarget prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zyskind JW;

Identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, for preparing vaccine or medicament for treating or preventing e.g. staphylococcal infections, comprises providing antibody

Example 7; Page 210; 252pp; English.

The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma consisted in a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the immunity. The hyperimmune serum-reactive antigens comprising any of the consistent hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The complex of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis. The autibody preparations may also correct include cancer, autoimmune diseases or infections may also treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This method for identifying and producing pathogen specific antigens of the invention.

This sequence represents Staphylococcus aureus cbrA DNA. The cbrA protein c is predicted to have a molecular weight of about 36.8 kD and, along with c berB (AAY42332) and cbrC (AX42333), is thought to be involved in iron c regulation, based on amino acid sequence homology with known iron c regulation, based on amino acid sequence homology with known iron repulator proteins. S. aureus is a ubiquitous pathogen which causes infections in burns, cellulitis, eyelid infections, food poisoning, joint infections, neonatal conjunctivitis, osteomyelitis, skin infections, connections, neonatal conjunctivitis, osteomyelitis, skin infections, such infections, scalded skin syndrome and toxic shock syndrome. S. aureus is increasingly becoming resistant to known antibiotics, with many strains generally being multiply drug resistant. Methicillin-resistant S. aureus (MRSA) poses serious infection control problems, with many strains being multiply drug resistant.

CC methicillin-resistant S. aureus (MRSA) poses serious infection control problems, with the exception of the vancomycin-type glycopeptide antibiotics with the exception of the vancomycin-type glycopeptide contable used as antibiotics and it may be used as a vaccine to prevent or attenuate an infection caused by a member of the could be used as antibiotics and it may be used as a vaccine to staphylococcus genus. The protein, or antibodies against it can be used in immunoassays to detect Staphylococcus in a biological sample.

CC detect Staphylococcus mucleic acid sequences may also be used to detect Staphylococcus in a biological sample.

This is the nucleotide sequence of Staphylococcus aureus strain ISP3
(ATCC 202108) genomic DNA including the novel cbrA gene that codes for a 310-amino acid protein (see AAY1824) of predicted mol.wt. 36.8 kDa. The sequence was obtained from overlapping clones BTACA44 and BTAGU54, which span a single operon containing the cbrA, cbrB and cbrC genes (see AAY1889-91). CbrA shows sequence homology to known genes involved in iron regulation. The invention provides 11 novel genes (see AAX1988-92) of S. aureus and the polypeptides they encode (see AAX18181-27). Also provided are vectors, host cells, antibodies and hybridomas. The invention further relates to screening methods for identifying agonists and antagonists of S. aureus polypeptide activity, and to diagnostic methods for detecting Staphylococcus nucleic acids, polypeptides and antibodies in a biological sample. Antagonists of cbrA may be useful as antibiotics to treat infections of S. aureus and other Staphylococcus spp. Also provided are novel vaccines for the prevention or attenuation of infection by Staphylococcus. The isolated nucleic acid molecule is also production of cbrA protein

The invention describes a new isolated nucleic acid molecule comprising: a sequence that is 95% identical to a fully defined sequence having 586-226 bp, or its complement; or a sequence encoding a polypeptide having a fully defined sequence comprising 136-691 amino acids, or its complement. The gene is Staphylococcus aureus gene. The nucleic acid is useful for preparing a vaccine against infection caused by Staphylococcus aureus. The methods are useful for preventing or attenuating an infection caused by a Staphylococcus, detecting Staphylococcus nucleic acids in a biological sample obtained from an animal, and detecting Staphylococcus antibodies in a biological sample obtained from an animal. This sequence
               New staphylococcus aureus gene, useful for preparing a vaccine against infection caused by Staphylococcus aureus.

The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA02. To isolate SEIP genes, an expression library of S. aureus genomic DNA was screened with anti-SBIP antisera. DNA was isolated from clones expressing SEIPs, and functional domains. The SEIP encoded by the present DNA sequence has sequence homology with the siderophore family of periplasmic binding proteins. The invention provides methods for the identification, production and recovery of SEIPs. The SEIPs can be used individually, or in combination, to produce anti-staphylococcal antibodies useful in staphylococcal infection. They can also be used to develop diagnostic

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable cof the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access commercial by a sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are composition against Saureus infection. The be used in a vaccine composition against Saureus infection of collypeptides can also be used in a kit for the immunodetection of Saureus in a sample. Saureus is implicated in numerous human diseases, containing cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used (and their fragments) are useful as primers or probes for isolating readable medium
                                                                                                                                                                                                                                                                              /*tag= a //note= "these bases represent a line of missing text in /note= "thesequence listing in the specification. New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 9415; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid cacid; (2) a host cell containing the vector; (3) an isolated cacid; (2) a host cell containing the vector; (3) an isolated catid; (2) a host cell containing the vector; (3) an isolated catid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the cativity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway capable of specifically binding to proliferation, or that inhibits cellular proliferation; (8) cerquired for proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound's activity; (11) a culture comprising strains in which the trains or (13) identifying the target of a compound that inhibits the conformal configuration of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound cacids are useful for cellular proliferation to isolate candidate molecic acids required for required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target

The invention describes a method of monitoring differential expression of the genes in cher Bacillus cells comprising hybridising labelled nucleic acid probes other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus (GCT), examining the array, and determining centaive gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of centain a first Bacillus cells The method is useful for monitoring one amore second Bacillus cells. The method is useful for monitoring in one or more second Bacillus cells. The method is useful for monitoring consistent in a first Bacillus cells and the function of unknown open reading frames and genes identifying possible functions of subschilty. Monitoring changes in expression of genes may be used to provide a representation of the way in white Bacillus cells adapt to changes in culture conditions.

CC in which Bacillus cells adapt to changes in culture conditions.

CC gene or one open reading frame, since sequence information is available.

CC gene or one open reading frame, since sequence tag (GST) used in the method of the invention. Note: The sequence data for this patent did not form to part of the printed specification, but was obtained in electronic format controlly from WIPO at ftp. wipo.int/pub/published_pcl_equences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food cuspidement. (II) and its binding partners are useful in medical imaging of supplement protein expression or biological activity. The colypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of muterions can be produce other types of data and products dependent on DNA and responsible for genetic disorders or other traits to assess biodiversity coding sequences AAS64497-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this coding sequences of the invention. Note: The sequence data for this celectronic format directly from WIPO at the enter of the coding accuence of the invention are sequenced to the coding accuences of the invention. Note: The sequence data for this celectronic format directly from WIPO at the coding accuences of the coding accuences of the coding accuences of the coding accuence data for this content with the printed specification, but was obtained in the printed specification, but was obtained in the printed of the coding accuences of the coding accuences of the coding accuences of the coding accuences of the coding accuences of the coding accuences of the coding accuence of the coding accuence of the coding accuence of the coding accuence of the coding accuence of the coding accuence of the coding accuence of

The invention relates to isolated polynucleotide (I) and polypeptide (II) captences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conservative of (II) is useful in gene therapy techniques to restore normal carivity of (II) or to treat disease states involving of (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in conversions of diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and conversion of the produce other types of data and products dependent on DNA and aming an action sequences. Assettly the convent human diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                65 GluTyrSerPheValAspAlaLeuValAlaLeuAspValLysProValGlylleAlaAsp

Polynucleotide(s) and proteins derived from Staphylococcus aureus -stored on computer readable medium and used in the production of anti-.aureus vaccines.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable cof the invention. The DNA sequences are recorded on a computer readable commedium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or CD-ROW. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The CC be used in a vaccine composition against S.aureus innuncdetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteonyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences come computer computer computer.

(I) is useful as hybridisation probes, polymerase chain concention (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed concention of useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and (II) and (II) and (II) and (II) are useful for treating disorders of stress expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in companies for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences Aps644197-AAAS94564 represent novel human disapnostic coding sequences of the invention. Nove: The sequence data for this patent did not appear in the printed specification, but was obtained in companies of the invention. Nove: The sequence data for this content views.
